

Pass Task 9.1 – Lost and Found Map Mobile App

Task Description

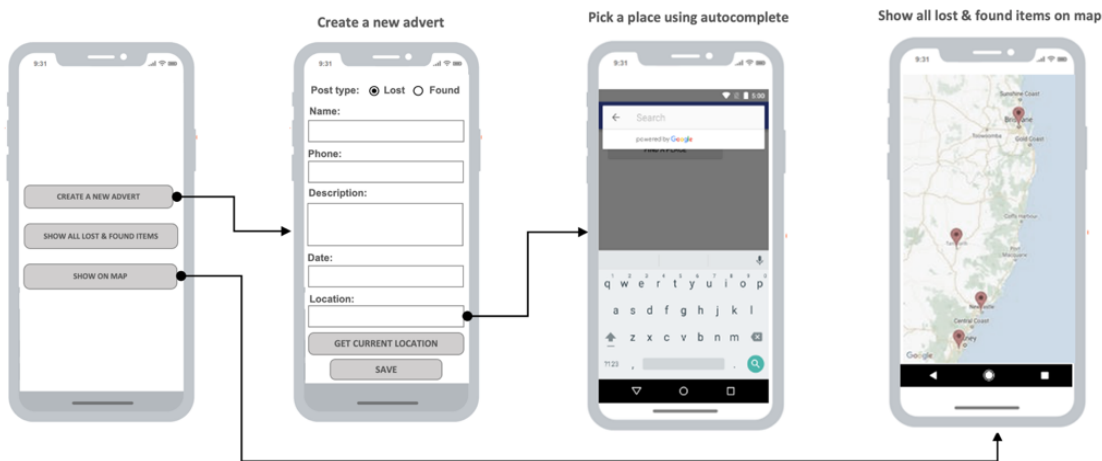

This assessment task intends to provide you with experience in Android geo features. You need to add geo features to the *Lost & Found mobile app* that you have developed in Task 7.1P. Your task is to build an android app that can capture all the requirements conveyed in that description.

Requirements:

You need to integrate the geo features and map into the lost and found mobile app in task 7.1P based on the following mobile app interface wireframes. A user will enter the location by clicking on the location text box and using *autocomplete feature* OR by clicking on the *GET CURRENT LOCATION* button to pick their current location. When a user clicks on the *SHOW ON MAP* button on the home page, all lost or found items will be shown on the map.

Subtask :

Require a **radius-based search** — show only items within X km of the user's current location

Additional Task for SIT 708:

SIT 708 students need to submit 250-300 words of descriptions for extending this task to a commercial mobile app (focus on why and how?).

Along with the report add a simple architecture diagram showing how the commercial app would be structured.

Submission Details: Task 9.1 – Lost and Found Map Mobile App

Note: You must follow the exact steps outlined below. Failure to comply with these formatting requirements may result in your task being marked as incomplete.

Responsible Use of AI: The use of Large Language Models (LLMs) is allowed only if declared.

Final Documentation Requirements

Your final submission must be a single **Word or PDF document** containing clear, **clickable links**. The document must include the following items: 1. LLM Declaration statement, 2. Research report, 3. Youtube link, 4. Github link, 5. LLM conversation link

1. LLM Declaration Statement

- A formal statement declaring whether or not you used a Chat LLM (e.g., ChatGPT, Gemini, etc.) to assist with this task.
- If AI was used, clearly list which parts of the code or research report were influenced by the AI.

2. Subtask : Research Report (500 Words) (SIT708 students only)

- **The full text of your 500-word report** must be included directly in this submission document along with architecture diagram.

3. YouTube Demonstration Video Link

- **Duration:** 4–5 minutes (Strictly **not more than 6 minutes**).
- **Content:** Explain the logic of your conversion functions and your UI structure. You must walk through your code and explain the specific actions it performs.
- **Demonstration:** Show the app running on a device/emulator, demonstrating all conversion categories (Currency, Fuel, Temperature).
- **Quality:** The video must have a clear visual of the student (webcam), the code, and high-quality audio.

4. GitHub Repository Link

- Upload your entire Android Studio project to GitHub.
- The repository **must be set to Public**.
- The repository must include a **detailed README.md file**.

5. LLM Conversation Link (If Applicable)

- Provide a direct, clickable link to the exact chat history between you and the LLM.
- Include the **exact prompt** given and the **reasoning** for the use of that exact prompt for that specific component.

Final submission is due by **8:00 PM AEST, Friday, Week 11**.
